Product Specification

Senseair S8 5%

Miniature infrared CO₂ sensor

Item	Senseair S8 5% Article No. 004-0-0017		
Target gas	Carbon dioxide (CO ₂)		
Operating Principle	Non-dispersive infrared (NDIR)		
Measurement range	0.04 - 5% _{vol} CO ₂ (Note 1)		
Measurement interval	2 seconds		
Accuracy	±200ppm ±10% of reading (Notes 2 and 3)		
Pressure dependence	+ 1.6% reading per kPa deviation from normal pressure		
Response time	2 minutes by 90%		
Operating temperature	5-50°C		
Operating humidity	0 — 85%RH non condensed		
Storage temperature	-40 — 70°C		
Dimensions	33.9 x 19.8 x 8.7mm (max dimensions)		
Weight	<8 grams		
Power supply	4.5 – 5.25V unprotected against surges and reverse connection		
Power consumption	300mA peak, 30mA average		
Life expectancy	15 years in normal commercial environments		
Serial communication	UART, Modbus protocol (Note 4). Direction control pin for direct connection to RS485 receiver integrated circuit.		
Alarm output, Open Collector	Alarm state open Alarm state open Alarm state open Co ₂ 8500/6500ppm Normally conducting max 100mA. Transistor open at CO ₂ High, OR Power Low, OR at Sensor Failure		
PWM output, 1 kHz	0 — 100% duty cycle for 0 — 50000ppm 3.3V push-pull CMOS output, unprotected		
Maintenance	Maintenance-free for normal indoor applications with Senseair ABC on.		

Table 1. Key technical specification for the Senseair S8 5%

Note 1:	Sensor is designed to measure in the range 0.04–5% with specified in the table accuracy. Nevertheless		
	exposure to concentrations below 400ppm may result in incorrect operation of ABC algorithm and shall be		
	avoided for model with ABC ON.		

Note 2: In normal IAQ applications, Accuracy is defined after minimum one ABC period (see table 4) of continuous operation with ABC ON.

Some industrial applications do require maintenance. Please, contact Senseair for further information!

Rev

14

Note 3: Accuracy is specified over operating temperature range. Specification is referenced to certified calibration mixtures. Uncertainty of calibration gas mixtures (±1% currently) is to be added to the specified accuracy for absolute measurements.

Note 4: See specification TDE2067 Modbus on S8. Resolution of serial output is 10ppm/bit.

Absolute maximum ratings

Stress greater than those listed in Table 2 may cause permanent damage to the device. These ratings are stress ratings only. Operation of the device at any condition outside those indicated in the operational section of these specifications is not implied. Exposure to absolute maximum rating for extended periods may affect device reliability.

Parameter	Minimum	Maximum	Units	Notes
Ambient temperature under bias	-40	85	С	
Voltage on G+ pin with respect to G0 pin	-0.3	5.5	V	1, 2
Maximum output current from active output pin	-25	+25	mA	1
Maximum current on input	-5	+5	uA	1
Maximum voltage on UART lines, PWM and bCAL_in	-0.3	DVCC_out +0.5	V	1
Maximum voltage on Alarm_OC	-0.3	G+	V	1, 3

Table 2. Absolute maximum ratings specification for the Senseair S8 Residential

Note 1: Specified parameter relies on specification of subcontractor and is not tested by Senseair

Note 2: Refer chapter "Terminal Description" for rated voltage information

Note 3: Alarm_OC pin is internally pulled up to G+. External pull up to higher voltage will provide resistive divider powering

sensor via high resistance.

Terminals description

The table below specifies terminals and I/O options dedicated in Senseair S8 5% model.

Pin Function	Pin description / Parameter description	Electrical specification
Power pins		
G0	Power supply minus terminal Reference (ground) terminal of sensor	
G+ referred to G0	Power supply plus terminal Operating voltage range	Unprotected against reverse connection! 4.5 –5.25V
DVCC_out	Output from voltage regulator of sensor Output may be used to logical level converter if master processor runs at 5V supply voltage.	Induced noise or excessive current drawn may affect sensor performance. External series resistor is strongly recommended if this pin is used.
	Series resistance	No internal protection!
	Nominal voltage	3.3 VDC
	Allowed source current	6mA max
	Voltage precision (Note 1)	± 0.75% is typical, ± 3% is max
Communication	pins	
UART_TxD	UART data transmission line Configured as digital output	No internal protection Pulled up to DVCC_out at processor reset (power up and power down).
	Absolute max voltage range (Note 1)	G0 - 0.3V to DVCC_out + 0.5V
	Internal pull up to DVCC_out resistor	120k
	Output low level (Note 1)	0.75VDC max at 10mA sink
	Output high level (Note 1)	2.4VDC at 2mA source
UART_RxD	UART data receive line Configured as digital input	No internal protection Pulled up to DVCC_out at processor reset (power up and power down)
	Absolute max voltage range (Note 1)	G0 - 0.3V to DVCC_out + 0.5V
	Internal pull up to DVCC_out resistor	120k
	Input low level (Note 1)	- 0.3 – 0.75V
	Input high level (Note 1)	2.3V to DVCC_out + 0.3V
UART_R/T	Direction control line for half duplex RS485 transceiver like MAX485. Configured as digital output.	No internal protection, Pulled down at processor reset (power up and power down).
	Absolute max voltage range(Note 1).	G0 - 0.3V to DVCC_out + 0.5V
	Internal pull down to G0 resistor.	120k
	Output low level (Note 1).	0.75VDC max at 10mA sink
	Output high level (Note 1).	2.4VDC at 2mA source

Table 3. I/O notations, description and electrical specification. (continued on next page)

Pin Function	Pin description / Parameter description	Electrical specification	
Input / output			
bCAL_in/ CAL	Digital input forcing background calibration. Configured as digital input (when closed for minimum 4, max 8 seconds) bCAL (background calibration) assuming 400ppm CO ₂ sensor exposure Zero calibration (when closed for minimum 16 seconds)	No internal protection, Pulled up to DVCC_out at processor reset (power up and power down).	
	CAL (zero calibration) assuming 0ppm CO2 sensor exposure		
	Absolute max voltage range(Note 1)	G0 - 0.3V to DVCC_out + 0.5V	
	Internal pull up to DVCC_out resistor	120k	
	Input low level (Note 1)	- 0.3 — 0.75V	
	Input high level (Note 1)	2.3V to DVCC_out + 0.3V	
PWM 1kHz	PWM output Configured as digital output	No internal protection, Pulled down at processor reset (power up and power down)	
	Used for direct reading by customer's microcontroller or to provide analog output.	,	
	Duty cycle min	0%, output Low	
	Duty cycle max	100%, output High	
	PWM resolution	0.5us ±4%	
	PWM period	1ms ±4%	
	Absolute max voltage range (Note 1)	G0 - 0.3V to DVCC_out + 0.5V	
	Internal pull down do G0 resistor	120k	
	Output low level (Note 1)	0.75VDC max at 10mA sink	
	Output high level (Note 1)	2.4VDC at 2mA source	
Alarm_OC	Open Collector output for alarm indication	No internal protection, Pulled up to G+ at processor reset (power up and power down)	
	Absolute max voltage range(Note 1)	G0 - 0.3V - 5.5V	
	Internal pull up to G+ resistor	120k	
	Max sink current (Note 1)	100mA	
	Saturation voltage (Note 1)	2.3V to DVCC_out + 0.3V

Mechanical properties

Refer to mechanical drawing for detailed specification of dimensions and tolerances. See Handling manual for S8 (ANO102).

Installation and soldering

See Handling manual for S8 (ANO102).

Maintenance and ABC (Automatic Baseline Correction)

The models based on Senseair S8 5% platform are basically maintenance free in normal environments thanks to the built-in self-correcting ABC algorithm (Automatic Baseline Correction). This algorithm constantly keeps track of lowest reading of the sensor over preconfigured time interval and slowly corrects for any long-term drift detected as compared to the expected fresh air value of 400ppm (or $0.04\%_{vol}$) CO₂.

Discuss your application with Senseair in order to get advice for a proper calibration strategy.

When checking the sensor accuracy, NOTE that the sensor accuracy is defined at continuous operation (at least one ABC period after installation with ABC turned ON)!

ABC parameter	Specification
ABC period	60 days

Table 4. ABC default configurations for Senseair S8 5%

Calibration

Rough handling and transportation might result in a reduction of sensor reading accuracy. With time, the ABC function will tune the readings back to the correct numbers. The default "tuning speed" is limited to about 150ppm/ABC period.

For post calibration convenience, in the event that one cannot wait for the ABC algorithm to cure any calibration offset two manual calibration procedures are offered. A switch input is defined for the operator or master system to select one of the two prepared calibration codes. Optional calibrations are bCAL (background calibration), which requires that the sensor is exposed to fresh air (400ppm CO₂) and CAL (zero calibration), which requires the sensor measuring cell to be completely evacuated from CO₂ e.g. by exposing it to Nitrogen or Soda Lime CO₂ scrubbed air. Make sure that the sensor environment is steady and calm!

Input	Default function	
bCAL_in	(when closed for minimum 4, max 8 seconds) bCAL (background calibration) assuming 400ppm CO ₂ sensor exposure	
CAL_in	(when closed for minimum 16 seconds) CAL (zero calibration) assuming 0ppm CO ₂ sensor exposure	

Table 5. Switch input default configurations for Senseair S8 5%

Self-diagnostics

The system contains complete self-diagnostic procedures. A full system test is executed automatically every time the power is turned on. In addition, constantly during operation, the sensor probes are checked against failure by checking the valid dynamic measurement ranges. All EEPROM updates, initiated by the sensor itself, as well as by external connections, are checked by subsequent memory read back and data comparisons. These different system checks return error bytes to the system RAM. The full error codes are available from the UART communication port. *Out of Range* error is the only bit that is reset automatically after return to normal state. All other error bits have to be reset after return to normal by UART overwrite, or by power off/on.

Error code and action plan

(Error code can be read via UART communication port)

Bit #	Error code	Error description	Suggested action
0	1	Fatal Error	Try to restart sensor by power OFF/ON. Contact local distributor.
1	2	Offset Error	Recovery procedure. Recovery failure - next step will be Fatal Error
2	4	Algorithm Error. Indicate wrong configuration.	Try to restart sensor by power OFF/ON. Check detailed settings and configuration with software tools. Contact local distributor.
3	8	Output Error Detected errors during output signals calculation and generation.	Check connections and loads of outputs. Check detailed status of outputs with software tools.
4	16	Self-Diagnostic Error. May indicate the need of zero calibration or sensor replacement.	Check detailed self-diagnostic status with software tools. Contact local distributor.
5	32	Out Of Range Error Accompanies most of other errors. Can also indicate overload or failures of sensors and inputs. Resets automatically after source of error disappearance.	Try sensor in fresh air. Perform CO ₂ background calibration. Check detailed status of measurements with software tools. See Note 1!
6	64	Memory Error Error during memory operations.	Check detailed settings and configuration with software tools.
7	128	Reserved	-

Table 6. Error codes for Senseair S8 5%

Note 1. If any probe is out of range. It occurs, for instance, during over-exposure of CO_2 sensor, in which case the error code will automatically reset when the measurement values return to normal. It could also indicate the need of zero point calibration. If the CO_2 readings are normal, and still the error code remains, any other sensor probe mounted (if any) can be defect, or the connection to this probe is broken.

If several errors are detected at the same time the different error code numbers will be added together into one combined error code!
